

# A New Type of Chemtrail in Indiana

**Jeff Grupp, guest writer, March 30, 2007**

On March 13, 2007, while probing the skies as I often do in my hometown of West Lafayette, Indiana, I noticed what appears to be a brand new sort of chemtrail.

I have heard authorities on chemtrails (such as Scott Stevens) say in interviews that there are plenty of strange, even surreal, things going on surrounding chemtrails. What I am about to describe appears to be such an event.

I had been watching chemtrails over my house on March 13 off-and-on over the afternoon, and near dusk I noticed something completely new, and which I had never seen in my experienced study and observation of chemtrails. This new sort of chemtrail I saw had something “leading it:” a dark grey line was protruding out of the leading edge of the chemtrail, and apparently out of, or from, the plane responsible for the chemtrail being created.

Here is the first picture I took:

You can see the remnants of other chemtrails in this picture, and where the new chemtrail with the black line is in the very center of the picture.

This black line got longer and more pronounced as the plane moved across the sky, and as these next pictures show (which are the next two pictures I took):

You can see in each of these pictures that there is another chemtrail being formed, criss-crossing and in the opposite direction of the black-line chemtrail, but where the other chemtrail does not exhibit the black line protruding out of the leading end of it. This verifies that there is no camera or optical error of any sort.

I watched this black line forming as the plane went across the sky. I would look in the sky, to the left of the forming chemtrail in the sky where the white part of the chemtrail was about to enter, and I would see the black line sort of gradually spring into being as the regular, white, chemtrail approached. It was as if this “black line chemtrail” had two parts, the black and the white parts overlapping, and the black part led the white part in its formation.

Here are the next pictures I took, which are even more revealing:

Notice that in this last picture, the two lines, black and white, appear side-by-side.  
What sort of chemtrail activity is this?  
Here is the last picture I took:

I have no theories on what sort of chemtrail this is, due to the fact that there are the two lines, black and white, that do not coincide in space at the leading end of the chemtrail. I sense there is a discovery waiting to be made in these pictures, and I am hopeful that Scott Stevens and other experts can reach this discovery, can illuminate on what this chemtrail might involve, and if it is any sort of new danger as compared to the more ordinary chemtrails that so many of us are familiar with.
